

The Ultimate Times Tables Resource Pack Teacher Guide

How to use this resource, and
best practice advice for teaching
times tables at primary school

Years 1 to 6

About this resource

The Ultimate Times Tables Resource Pack is designed to support primary school teachers to embed a thorough understanding of times tables in their school.

What's included

There are six packs; one for each year group from Year 1 to Year 6. Within each pack you will find:

-  This teacher guide which outlines the key pedagogical approaches to teaching times tables throughout the primary phase.
-  Games and activities appropriate for that year to do inside and outside of the classroom.
-  15 times tables tests per year group with associated tracking / self-assessment and answers to support pupils and help teachers pinpoint their gaps.

Teacher Guide (resource for you)

Your first 'stop' in this resource should be the pedagogy information on page 6 of this guide which outlines the key approaches to teaching multiplication. This section also provides examples of the different ways multiplication can be represented and explains how these can be used to support children in developing a conceptual understanding and, ultimately, true fluency.

Times Tables Games and Activities (slides)

The activities each provide two slides of teacher notes which outline how to run the activity, as well as key questions to ask during the activity to help draw out and develop children's conceptual understanding.

Teacher

Year 4

Ultimate Times Tables Resource Pack

Five in a row

Y4

Running the activity:

- Hand out a copy of the 'Five in a row' sheet to each pair of children, along with some counters. Each child in the pair needs a different colour counter.
- The aim of the game is for children to place counters so that they get five counters in a row, either horizontally, vertically or diagonally.
- To place a counter, they must point to the number on the sheet, and say **two** multiplication or division facts that involve the number they have pointed at. They cannot use the one times table. For example, if they pointed at 30, they could say '5 x 6 = 30, 30 ÷ 10 = 3'.
- If they say a correct fact, and their partner agrees, they can place their counter. If they say an incorrect fact (and their partner spots it) they do not get to place their counter.
- Players take it in turns to attempt to place their counters until one player has placed five of their counters in a row.

Focus

Recognise and use multiplication and division facts for the 2, 3, 4, 5, 8 and 10 times tables.

You will need:

- Five in a row (Resource 1) for each pair of pupils
- Two counters of different colours

THIRD SPACE LEARNING thirdspacelearning.com Specialist 1-to-1 maths interventions and curriculum resources

Teacher

Year 4

Ultimate Times Tables Resource Pack

Five in a row

Y4

Key questions to ask:

- What multiplication or division facts are linked to the number you want to cover?
- Are there any more facts that you could have said?
- Are any numbers on the grid linked to more than 2 times tables? Which ones?

Taking it further

Challenge children by asking them to identify at least three facts involving the number they want to cover before they can cover it.

THIRD SPACE LEARNING thirdspacelearning.com Specialist 1-to-1 maths interventions and curriculum resources

Each activity is also accompanied by a suggestion of how it can be extended to further develop understanding.

There is also a pupil facing slide for each activity.

Most of these slides are optional but are designed to introduce the activity to the children. Occasionally they provide key prompts and information that children will need during the activity.

The activities are designed so that they can be picked up and used throughout the school day, and most can fit within a 'spare' 10 minutes.

Most activities can easily be used more than once, and they can all be adapted for other times tables.

Pupil

Year 4

Ultimate Times Tables Resource Pack

Five in a row

Y4

Can you get five counters in a row before your partner?

To cover a square, you must say at least two multiplication or division facts that involve the number, which are NOT from the 1 times table.

For example, if you wanted to cover '30' you could say **any two** of the following:

$30 \div 5 = 6$, $30 \div 6 = 5$, $6 \times 5 = 30$, $5 \times 6 = 30$, $30 \div 10 = 3$, $30 \div 3 = 10$, $3 \times 10 = 30$, $10 \times 3 = 30$

Things to think about

Can you give at least three facts for the number you want to cover?

THIRD SPACE LEARNING thirdspacelearning.com Specialist 1-to-1 maths interventions and curriculum resources

A note on the games and activities

Within the resource we deliberately use a mixture of digits e.g. 7 and words e.g. seven, to enable children to become familiar with both variations. You'll also notice that the pupil slides only include illustrations when they support conceptual understanding. In line with the principles of teaching for mastery we have avoided any purely 'decorative' illustrations.

Times Tables Resources (printable sheets)

Some of the games and activities require resources to support them. Most of these you'll have in your classroom – such as number squares or counters. We have also included a number of printable resource where required.

These range from digit cards for use in an active maths game to a fun board game that children can play together.

Times Tables Tests (printable sheets)

Each year group's pack contains 15 tests. These are designed to be used on a rolling basis - work through the tests in order, and then start the suite of tests again. They can be used on a daily or weekly basis, depending on your schedule and school.

Each test should take **3** minutes.

After children have marked their test, they should be encouraged to use the Assessment 'how did you do' grids for each test. They should shade in the squares containing the question numbers which they got **correct**. By doing this, they will create a handy visual representation of their strengths and gaps in learning. They can also be used by the teacher to help assess the class as a whole, informing future planning and ensuring the teaching covers any common areas of weakness.

Pedagogy Guide for teaching times tables

Progression in teaching multiplication

Children should be encouraged to investigate, see, understand and use the many connections between different multiplication tables. By doing this, they demonstrate true fluency and ultimately reduce the amount of ‘facts’ they need to store. This facilitates the goal of being fluent in the 1-12 times tables in time for the multiplication check in Year 4.

To help with this, it is strongly suggested that the multiplication tables are introduced in the following order.

Key Stage 1			Year 3			Year 4					Year 5 and 6
2x	5x	10x	4x	8 x	3 x	6x	7 x	9 x	11x	12x	Continue to build fluency, and linked facts, including Powers of 10 (e.g. 30 x 40) and decimals in Year 6 (e.g. 0.3 x 3)
[See note below]			(linked to 2 x)	(linked to 2x and 4 x)	(linked to 2x)	(linked to 3 x)	(linked to 6 x)	(linked to 10 x)	(linked to 10 x)	(linked to 10 x and 2 x)	

Times tables in Key Stage 1

In Year 1, times tables are introduced using the terms ‘lots of’ and ‘groups of’ only – there is no use of the multiplication symbol or writing formal multiplication sentences.

In Year 2, continue to build fluency and introduce multiplication and division symbols and link multiplication and division facts.

Representing multiplication in different ways

When exploring any multiplication table, it is important that children are continually exposed to the different ways in which multiplication can be represented.

The two main representations for multiplication are **repeated addition** and **arrays**. These two representations are linked to each other.

Repeated addition

Multiplication can be represented as repeated addition, which can be shown on a number line.

Counters and other manipulatives, alongside tens frames can be used.

$$3 \times 2 = 6$$

Or, if children are secure with one-to-one correspondence and counting in multiples, they can be used without the manipulatives.

$$8 \times 5 = 40$$

Arrays

Arrays are also a key representation for multiplication, and children should be encouraged to physically create and manipulate arrays, both by themselves and alongside repeated addition on the number line.

For example,

$$2 \times 3 = 6$$

$$5 \times 4 = 20$$

Arrays are also important as they can easily show, by rotating the array, the **commutative property** of multiplication.

$2 \times 3 = 6$ is the same as $3 \times 2 = 6$

Doubling

Doubling is a key skill that should be introduced from Year 1 and should continue to be developed with more complex numbers in each year group.

Doubling is important as it is used to relate the 'foundation' multiplication facts (2, 5 and 10 x) with other multiplication facts.

Doubling can be represented in many ways, including arrays:

e.g. double 12 is 24

$$12 + 12 = 24$$

Number shapes

9

Double 9

= 18

Number shapes are useful for helping children to understand and visualise why the answer to double a number is always even (as odd + odd = even)

Children can also use part-whole models and partitioning to help them double larger numbers. For example, the part-whole model can be used to help children double 36.

The 2, 5 and 10 times tables

In Key Stage 1, children are introduced to the 2, 5 and 10 times tables, and should enter Lower Key Stage 2 being relatively secure with these foundation multiplication tables.

The 2, 5 and 10 times tables are used as ‘foundation’ multiplication tables which children use to work out a range of other multiplication facts – for example, the two times table can be used to work out the four times table (through doubling).

The 2, 5 and 10 times tables should be introduced using a range of manipulatives, including tens frames, arrays, repeated addition on the number line and number shapes.

You should encourage children to use their representations to help them draw out patterns in multiplication tables. For example, the patterns in the 5 times table can be effectively drawn out using tens frames. Multiplication tables can be drawn out by using tens frames.

The inverse relationship between multiplication and division

From Year 2, children should be conceptually introduced to the relationship between multiplication and division. It is important that starting in Year 2, children are encouraged to consider, investigate, use and practise the related division facts.

Multiplication and division are inverse operations. This means that multiplication is the opposite of division, and division is the opposite of multiplication. In other words, division 'undoes' multiplication, and multiplication 'undoes' division.

This can be represented using arrays.

So, if children know that 3 lots of 6, or 3×6 , is 18, then they also know that **18 in groups of 6 is 3**.

3 lots of 6 or $3 \times 6 = 18$

18 in groups of 6 = 3 groups or $18 \div 6 = 3$

And because multiplication is commutative, $6 \times 3 = 18$ also means that $18 \div 3 = 6$.

It is important to stress to children that, unlike multiplication, division is not commutative – as $18 \div 3$ is not the same as $3 \div 18$.

6 lots of 3 or $6 \times 3 = 18$

18 in groups of 3 = 6 groups or $18 \div 3 = 6$

Introducing the 4 times table

The four times table can be linked to the children's existing knowledge of the two times table. Answers to the four times table are double (or $2 \times$) the corresponding answer for the two times table.

For example:

$$2 \times 5 = 10$$

$$4 \times 5 = 20 \text{ (} 2 \times 10 \text{)}$$

This relationship can be effectively shown using arrays made from two different colour counters, as shown below.

$$2 \times 5 = 10$$

$$4 \times 5 = 20 \text{ (or 2 lots of 10)}$$

Introducing the 8 times table

The eight times table should be the next times table that children are introduced to in lower Key Stage 2. This is because, just like the link between the 2 and 4 times tables, doubling can be used to help children calculate their 8 times table based on existing times table knowledge. Introducing the 8 times table after the 4 times table helps children to see the link between different multiplication tables.

Answers to the 8 times table are double (or 2x) the corresponding answer for the 4 times table.

$$5 \times 4 = 20 \text{ so } 5 \times 8 = 20 + 20 \text{ (or double 20) which means } 5 \times 8 = 40.$$

This relationship can be represented using an arrays.

$$3 \times 4 = 12$$

$$\text{therefore } 3 \times 8 = 24$$

$$12 + 12 = 24$$

Remind children they can use part-whole models, as shown in the 'doubling' section of this guide, to help them double larger numbers.

Children can also begin to investigate the relationship between the 2 times table and the 8 times table.

Introducing the 3 times table

The three times table should be the next times table that children are introduced to in Lower Key Stage 2.

The three times table can also be linked to the two times table.

If $2 \times 4 = 8$ (2 lots of 4 is 8) 3×4 (3 lots of 4) is just one more 'lot' of 4.

This can be represented using both repeated addition on a number line, and an array.

$$2 \times 4 = 8$$

Therefore 3×4 or 3 lots of 4 would just be one more 'lot' of 4.

And because of the commutative nature, we can show that 3×4 is the same as 4×3 .

So children can work out the answer to the three times table by finding out the corresponding answer to the 2 times table (using their inverse relationships if needed) and adding another 'lot' of the number they are multiplying.

For example, to work out 6×3 , children can work out 6×2 and add 6.

Introducing the 6 times table

Just like the relationship between the two and four times table, the six times table can be linked to the three times table by doubling.

$$4 \times 3 = 12$$

$$4 \times 6 = \text{double } 12$$

Draw attention to the fact that 6 is **double** 3. Because of this, they know that 4 lots of 6 is **double** 4 lots of 3.

This can be represented using arrays.

The number line can also be used to represent the relationship between the 3 and 6 times tables.

Introducing the 7 times table

Just as with the 2 and 3 times table, children can use addition to link the 6 and 7 times table.

$6 \times 3 = 18$ (6 lots of 3 is 18) therefore 7×3 is just one more 'lot' of 3.

$$7 \times 3 = 18 + 3 = 21$$

This can effectively be represented using a number line.

$$6 \times 3 = 18$$

$$\text{Therefore } 7 \times 3 = 6 \times 3 + 3$$

This can be linked to arrays, and therefore the commutative relationship can be seen.

You can easily show that 7 lots of 3 or $7 \times 3 = 21$ is the same as 3 lots of 7, or $3 \times 7 = 21$

$$7 \times 3 = 21$$

$$3 \times 7 = 21$$

Introducing the 9 times table

By the time children are formally introduced to the nine times table, they can actually already calculate most of the nine times table by using their existing times table knowledge and the fact that multiplication is commutative.

For example, they should be encouraged to use their three times table to work out $3 \times 9 = 27$, as $3 \times 9 = 9 \times 3$.

Children should explore the link between the ten times table and the nine times table. They should notice every answer to a number multiplied by 9, is just ‘one lot’ less than the answer to the same number multiplied by 10.

For example:

$$6 \times 10 = 60$$

$$60 - 6 = 54$$

$$\text{so } 6 \times 9 = 54$$

Arrays and the number line can be used to help represent this relationship:

Children may also notice patterns in the 9 times table. For example, that the digit root (the addition of the digits in the number, regardless of their place value, until it reaches a single digit answer) always equals 9 (e.g. The digit root of 99 is 9 as $9 + 9 = 18$, $1 + 8 = 9$) or that, for $1 - 10 \times 9$, the tens digit increased by 1, from 0, and the ones digit decreased by 1 from 9.

However, **it is important that the reason these relationships exist (i.e. due to the link between the 10 and 9 times table) is explored**, rather than them simply being learnt as ‘tricks’ without meaning. Tens frames can help children unpick this relationship.

Introducing the 11 times table

Just like the nine times table, it is important that when introducing the eleven times table, you draw attention to the fact that children can use their existing times table knowledge and the commutative nature of multiplication to work out the majority of their eleven times table.

Children should also be encouraged to explore the link between the 10 and 11 times tables.

For example, using their commutative facts, they may notice that:

$8 \times 11 = 88$ is just one lot of 8 more than $8 \times 10 = 80$

$3 \times 11 = 33$ is just one lot of 3 more than $3 \times 10 = 30$

Therefore they can always use their 10 times table to help them work out their 11 times table.

This relationship is best represented using an array.

Children may also notice patterns in their eleven times table. For example, it is common for children to state that ‘you put the digit you are multiplying by twice’, by which they mean that 3×11 is **33**. However, it is important for children to explore why this pattern exists. (Since 10 times a number is always a multiple of 10, the answer to $11 \times$ the same number will always be the multiple of 10 plus the number you are multiplying by, which creates the ‘double digit’ effect).

Children should also investigate at what point any patterns they notice break down (for example, 11×11 is not 1111, which is a common answer if children have not developed the conceptual understanding behind the pattern they have noticed).

Introducing the 12 times table

The twelve times table is often the last times table introduced in Lower Key Stage 2. Again, children should be encouraged to realise that, due to the commutative nature of multiplication, they can work out all but one of their twelve times table by using the

times table facts they already know. For example, 9×12 can be solved using the 12×9 multiplication fact.

Therefore, children should identify that 12×12 is the only 'new' multiplication fact in the twelve times table.

They should be encouraged to use their existing multiplication facts to work this out.

For example, they could notice that using the distributive law, they can write 12×12 as 12×10 and 12×2 (or $12 \times 10 + 12 \times 2$). Therefore, $12 \times 12 = 120 + 24 = 144$.

The distributive law and its usefulness for calculating 12×12 using existing facts can easily be represented using an array.

Continuing times table learning in Upper Key Stage 2

It is important that children's fluency in their 1-12 times table is maintained throughout Upper Key Stage 2. They will use their times table facts to help them in a wide range of maths topics, as well as when using formal methods of multiplication and division.

Children should also be introduced to a wider range of related facts for their 1-12 times tables. In year 5, children should explore the relationship between the 1-12 times tables and multiplication questions that involve multiples of 10 (e.g. how is 20×3 linked to 2×3).

It is important that these links are explored conceptually. Children should realise that if a number in the multiplication is ten times larger than a related fact, then the answer to the multiplication will also be ten times larger.

e.g. $40 \times 6 = 240$ as 40 is ten times larger than 4, and therefore the answer to 40×6 is ten times larger than the answer to $4 \times 6 = 24$.

This can then be extended to multiples of 10 and 100. For example, $40 \times 60 = 2,400$, as 40 is ten times larger than 4, and 60 is ten times larger than 6, and therefore the answer to 40×60 is $4 \times 6 \times 10 \times 10$.

The distributive and associative law should also be used to explain this relationship.

The associative law means that 40×60 is the same as $4 \times 10 \times 6 \times 10$, which can be written as $4 \times 6 \times 10 \times 10$, which could also be written as $4 \times 6 \times 100$.

In Year 6, this knowledge and understanding should be extended to decimal numbers.

Where to find all your resources

The Ultimate Times Tables Resource Pack is one of Third Space Learning's premium Maths Hub resources and can be found by visiting mathshub.thirdspacelearning.com.

Like all our resources, they have been created by primary maths expert authors and practising teachers to support schools on their journey towards mastery in maths.

When you have identified those target pupils who need more intensive and personalised support than classroom teaching can provide, our 1-to-1 interventions will enable any child to make rapid progress and develop conceptual as well as procedural understanding.

Get in touch if you want to find out more: thirdspacelearning.com.

Do you have a group of pupils who need a boost in maths this term?

Each pupil could receive a personalised lesson every week from our specialist 1-to-1 maths tutors.

- Raise attainment
 - Plug any gaps or misconceptions
 - Boost confidence
